Dear Hiring team,

I am applying for the AI Engineer role. I design, build and run AI-driven applications in Python from prototype through to production, which I believe is the core of what you are asking for.

Over the last 18 months I have built and run two live platforms. WitsWriter is an AI research and document platform that uses retrieval-augmented generation over users' own documents. I deployed its embedding model as a separate self-hosted service, which reduced reliance on external AI APIs and cut costs. Bridge44 is a social media management platform with a Python and FastAPI back end, AI comment analysis, multi-turn conversation handling and an MCP interface so AI agents can use it directly. Both run in production with CI/CD pipelines and monitoring through Sentry and PostHog, and I have fixed live issues from error data, such as a token-refresh fault that I traced to the timing of a handler and corrected.

Before this I spent 14 years in software and data roles, including six years at a regional public body. There I led a data management strategy adopted by six states, worked with technical and non-technical stakeholders, and mentored an intern and junior colleagues. That experience taught me to explain technical choices plainly and to document my work so others can maintain it.

I would bring autonomy, solid Python fundamentals and a habit of delivering working software to your team, and I am comfortable working with colleagues across different locations and am willing to go through security clearance checks.

I would welcome the chance to discuss how my experience fits your projects. Thank you for your time.

Yours sincerely,

Peter Ibikunle
